

Row the Net

- Introduction
 - background
- Implementation
 - hardware
 - software
- further development
- Conclusions

- raise awareness of social & cultural connectivity
- bring this into relation with geographical connectivity
- allow user to experience the *connection* rather than the *connected*

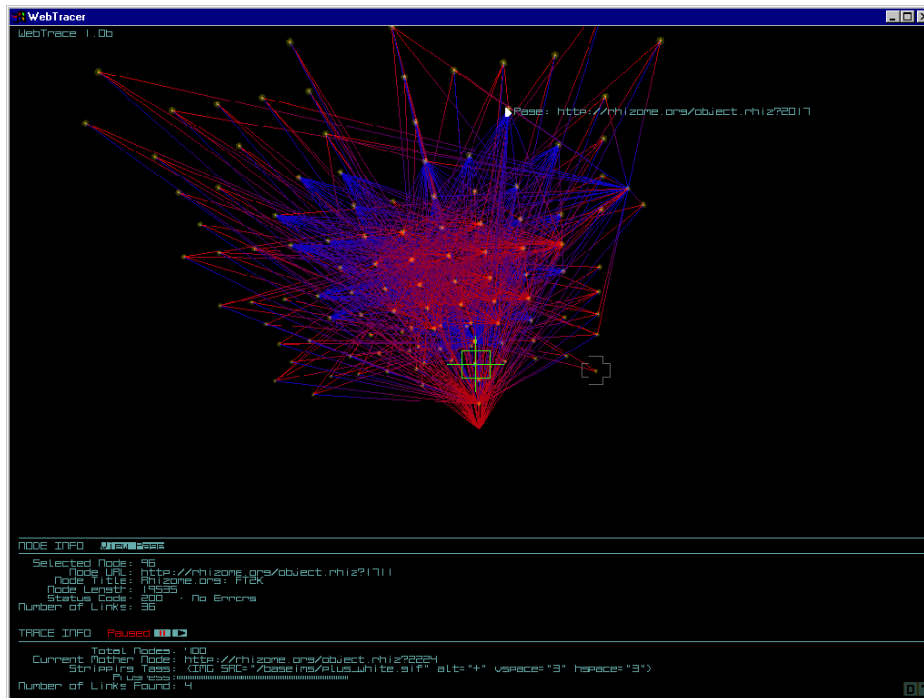

Row the Net

exploring the WWW

- haptic webbrowser
 - real physical interaction
- 3D-visualisation
 - semantic/cultural/geographic conn.
- dynamic space
 - interactive reconfiguration of space

- network visualization
 - typical "net.art"
 - usually non-interactive
 - technical parameters
 - abstract IP-space
 - region of interest
 - mapping of the entire "known world"
 - e.g. W. Ritsch: *route-tracer*
 - probing

- new interactive interfaces to the WWW
 - „Browser Art“
 - e.g. *webtracer* (nullpointer)

Row the Net

even more history

- physical interfaces to semantic worlds
 - Geoffrey Shaw:
The legible City

Row the Net

[video]

Row the Net

interface

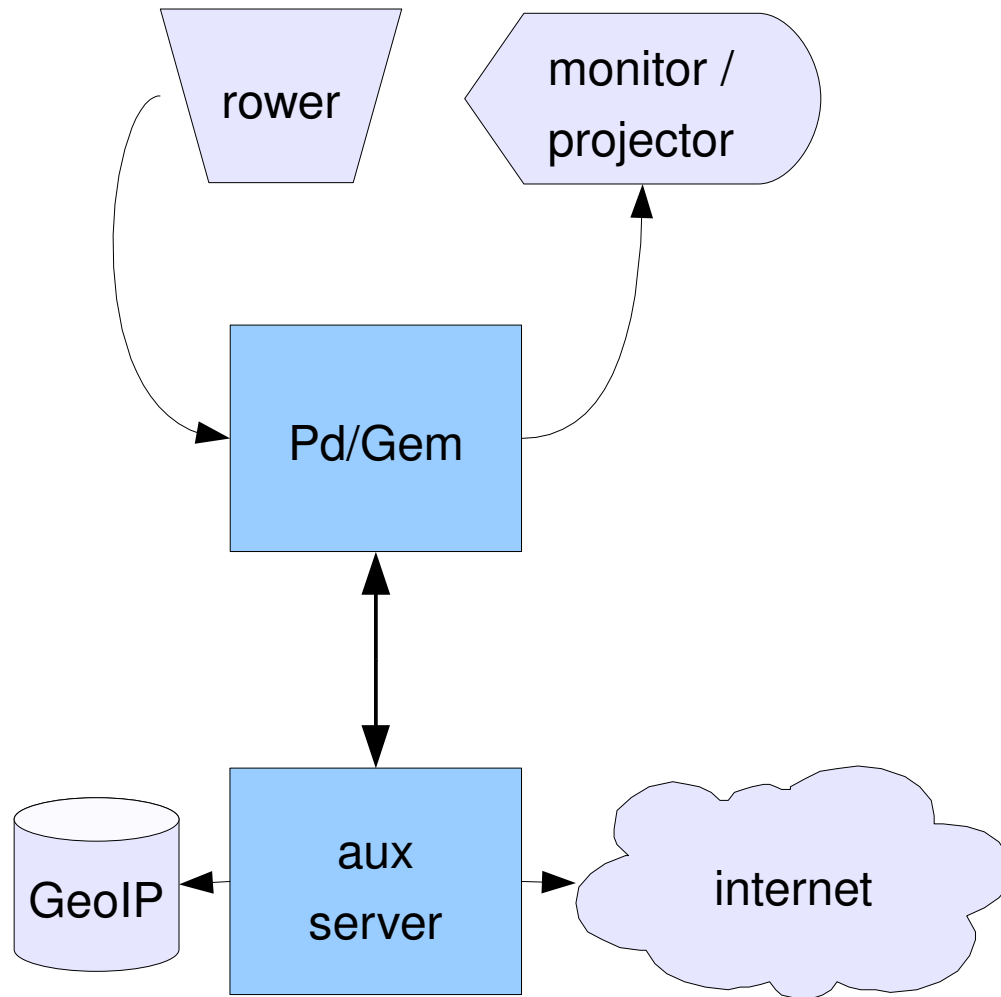

- physical interface
 - **hard work!**
 - standard rowing exercise machine

- rower → 2 „independent“ movements
 - left/right hand
 - 2 potentiometers
 - 1 per „oar“
 - joystick: analog-to-USB converter
 - HID-data

Row the Net

software

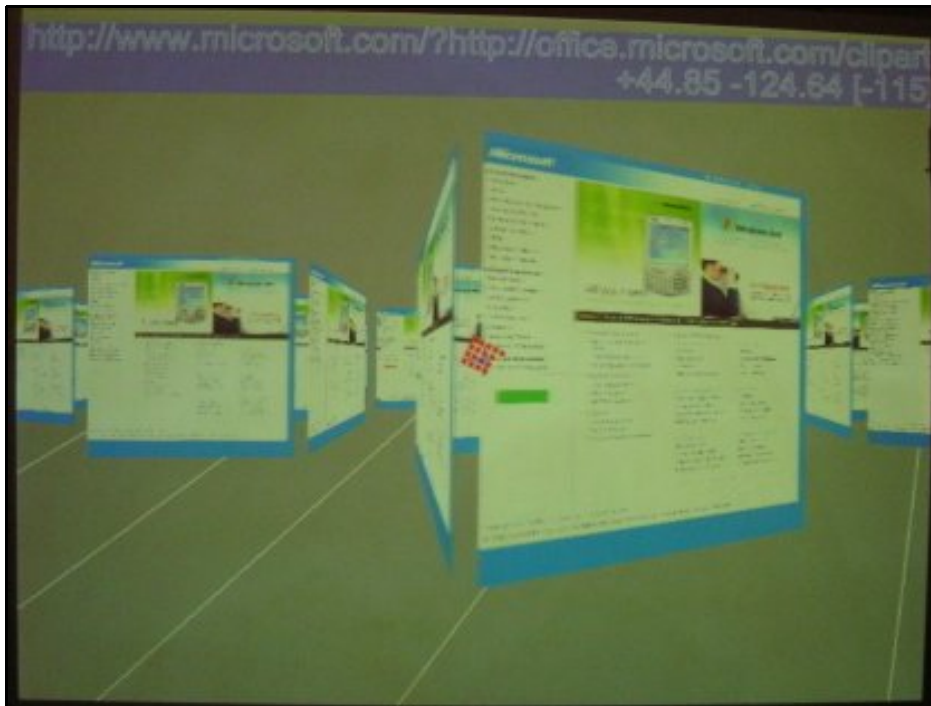

- System

- Linux (Debian)
- Pure data / Gem
 - hardware interfacing
 - visualization
- auxiliary daemon
 - snapshots of websites
 - link extraction
 - geographic data

How to get websites into the system?

- GUI tools
 - focus stealing (pop-ups!)
 - not scriptable (remote control)
- online-solutions
 - resource intensive
 - don't want to get banned!

- *khtml2png*
 - command line tool
 - off-screen rendering
 - Konqueror HTML-rendering engine
 - Safari/Konqueror
 - additional bonus of link-extraction
 - Open Source!

- all links visible
 - links from *current* page
- enter a site:
 - just row into it
- virtual hosts
 - flat clusters
 - towers
 - paternoster

Row the Net

visualisation

- mapping web pages

- spatial mapping
 - GeoIP services
 - online
 - latitude / longitude of server
 - same position → neighbourhood

Row the Net

browser navigation

- long distances between pages
 - cross the Atlantic
 - navigation on „empty screen“
 - flat world
 - great circle navigation
- **row, row, row!**

- Problem

- several pages visible at the same time
- not just *current* page
- also *pages linked* from current page

- Solution

- asynchronous
 - pages pop up as they are grabbed
- caching

- Problem
 - page types involving interaction
- ignore forms – just viewing
 - no keyboard!
- ignore “problematic” content
 - self-signed certificates require user-interaction
 - not-installed plugins
 - filter out content (based on URL)

- “Back” functionality
 - requires keeping history
 - avoid jamming of old sites
- → simply no “back” functionality
 - dead-ends?
 - inspect sites whether they contain links
 - do not expose dead-links

Row the Net

further implementations

- Race-the-Net
 - game-like environment
 - racing wheel game controller
 - fast!
 - hard to "hit" pages
 - scoring
 - linking far away pages gives points

Row the Net

Race the Net

- different browsing behaviour
 - avoid long distances
 - rowing is exhausting
- connectedness
 - traditional sites
 - small sites, highly interlinked
 - modern sites
 - portal
 - hardly any links outside

- geographical distribution
 - not very surprising
 - Europe
 - North America (East Coast, West Coast)
 - Australia / Japan
 - ~~Yemen~~
 - net.art communities
 - concentration at certain places
 - e.g. mur.at ↔ Graz, AT
